

High-Level Workspace Overview

Key Directories

- **app** – Flask package with `__init__.py`, middleware, extensions, blueprints, services, and utilities. All HTTP routes live in `app/blueprints` and are registered during app factory initialization.
- **blueprints** (root legacy folder) – Older blueprint implementations kept for reference or migration support.
- **cases** – Tenant-scoped case assets generated by the AI pipeline (`cases/<tenant>/<case>`), including Chroma vector stores and cached outputs.
- **data**, **ementas_kb_store** – Raw/processed datasets, FAISS indexes, and knowledge-base stores for jurisprudence search.
- **docs** – Project documentation, deployment notes, diagrams (e.g., `app_workflow.mmd`).
- **static** and **templates** – Frontend assets and Jinja templates rendered by HTMX endpoints.
- **tests** – Automated test suites.
- **alembic** – Database migrations history.

Core Files

- `config.py` – Environment-driven settings (DB credentials, multi-tenant flags, logging levels, etc.).
- `cadastro_manager.py` – Central Postgres access layer with tenant filtering and CRUD helpers.
- `pipeline.py`, `ingestion_module.py`, `analysis_module.py`, `petition_module.py` – AI workflow orchestrator and supporting modules for document ingestion, FIRAC analysis, and petition generation.
- `logging_config.py`, `middleware.py` – Structured logging and request-level instrumentation.
- `requirements.txt`, `requirements-dev.txt`, `Makefile`, `wsgi.py` – Dependency lists and deployment entry points.

Workflow Summary

1. **HTTP Entry:** Gunicorn serves the Flask app (`app.create_app()`), which registers middleware and blueprints.
2. **Authentication/Tenant Resolution:** Middleware populates `g.tenant_id` and Flask-Login enforces access controls.
3. **Business Logic:** Blueprints invoke service classes (e.g., `CadastroService`) that delegate to `CadastroManager` for tenant-aware DB queries.
4. **AI Components:** The `Pipeline` module manages case ingestion, embeddings, and AI analyses within tenant-specific storage directories.
5. **Rendering:** Routes return Jinja templates or HTMX partials from `templates/`, with asset support from `static/`.
6. **Persistence & Migrations:** Postgres schema maintained via Alembic; vector stores and KB data stored under `cases/`, `kb_store/`, and `ementas_kb_store/`.

This outline provides a quick reference for onboarding, navigation, and architectural context. Update as new modules or directories are introduced.

This app is hosted in a Droplet – DigitalOcean and is uploaded via GitHub – git push
